Student/Customer
DrivePass System
Secretary
Select Schedule Driving Appointment
Enter preferred date and time
Check instructor and vehicle availablilty
Is a time available?
No
Choose a different date/time
Yes
Review avaiable time slots
Display avaiable time slots
Verify appointment details
Select a time slot and confirm
Reserve appointment in system
Assign instructor and vehicle
Receive appointment confirmation
Send appointment confirmation to student
Confirm appointment in schedule

UML Class Diagram

Technical Requirements

Hardware: The DriverPass system will need to have computers or other internet-connected devices for students and employees to access the system. Students will use these devices to schedule driving appointments, view online classes, take practice tests, and check on their progress. Employees will need devices to manage student information, schedules, driving lesson notes, and user accounts.

Software: DriverPass will need a web-based application that supports appointment scheduling, training packages, onlines classes, practice tests, student records, and progress tracing. A database will be needed

to store student information, appointment details, instructor and vehicle assignments, test results, and the lesson notes. The ystem should also include some sort of secure user authentication and role-based access so the users can only access the features allowed based on their roles.

Tools: Lucidchart will be used to create the UML diagrams for the system design. Development and testing tools will also be needed to build the application, check that its features are working as they should, and fix any problems that occur. The system should be tested to make sure that the students can schedule, or change appointments and employees can manage records and schedules as expected.

Infrastructure: DriverPass will need reliable internet access and web hosting so that the students and employees can use the system online. The system will require secure data storage, regular backups, and appropriate access controls to help protect student information. It should also support updates to DMV rules, policies, and practice-test information so the information available to students can be kept current.
